

What is Fractal Hub and what is it used for?

 help.fractal.com/hc/en-us/articles/41018693992333-What-is-Fractal-Hub-and-what-is-it-used-for

Fractal Hub is an add-on integrated into **Fractal One** that allows seamless connection and integration between the maintenance management platform and various external systems, such as ERPs, spreadsheets, databases, or web applications.

Fractal Hub is a catalyst for more effective and secure business management. Its ability to communicate efficiently with diverse applications, its focus on security, and its adaptable configuration position it as an essential tool in the modern business landscape.

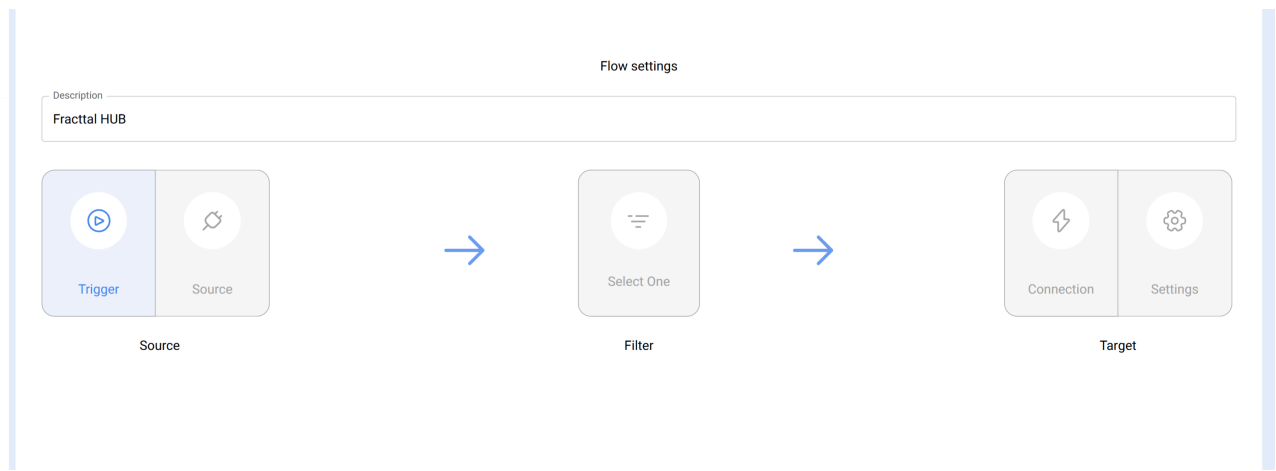

What is it used for?

Fractal Hub serves as an intelligent bridge between Fractal One and other corporate tools, enabling:

- Integration of ERP systems, Google Sheets, HTTP requests, emails, and databases.
- **Automation of information flows**, by configuring events or triggers that execute actions on a scheduled basis.
- **Reduction of technical complexity** in integrations, thanks to its **low-code** approach that simplifies the configuration and management of connections.

Within Fractal One, Fractal Hub acts as a **middleware** or integration center that connects information between the different modules of the platform and external systems. Each integration flow consists of:

- **Source:** where the data comes from.
- **Destination:** where it is sent to.
- **Trigger:** what event or condition initiates the action.
- **Connection:** credentials and configuration of the communication channel.
