

Fracttal Hub

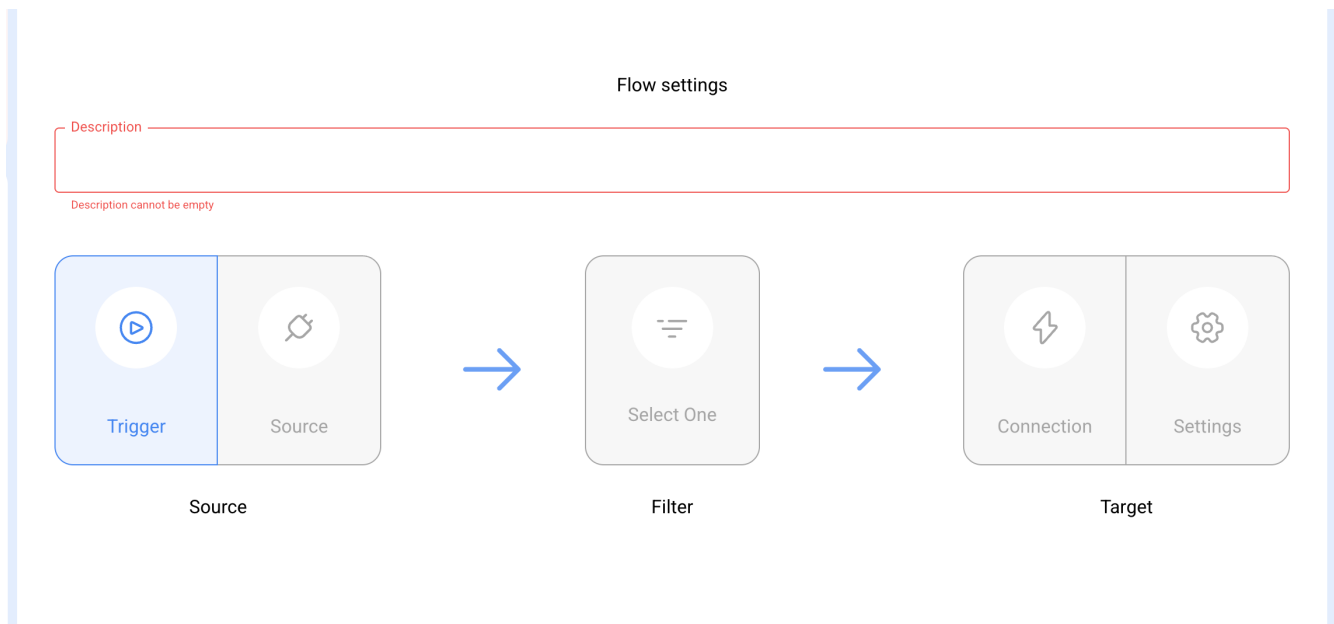

help.fracttal.com/hc/en-us/articles/24913914496909-Fracttal-Hub

Fracttal Hub is an add-on for Fracttal One that connects the platform with external systems through bidirectional communication. With Fracttal Hub, you integrate Fracttal One with Google Sheets, HTTP Request, email, databases, and Fracttal's own API, moving data between these tools reliably, without information loss.

How to access Fracttal Hub?

1. In the main menu, click on **Automator**.
2. Within Automator, select **Fracttal Hub**.

What can you do with Fractal Hub?

Connect with multiple applications

Fractal Hub communicates bidirectionally with Google Sheets, HTTP Request, email, databases, and the Fractal API. You can combine these connections according to the tools you already use, without leaving Fractal One.

Define when each integration runs

Each integration is triggered by an activator. You choose between manual execution, scheduled dates, or defined frequencies, so data is synchronized at the time you need.

Control data security

Fractal Hub transfers information through authentication using credentials and tokens. You can create permission groups to identify each consumer and control which data they access and to what extent.

With connections configured, Fractal Hub keeps data synchronized between Fractal One and your other systems according to the activator you define.
