

Managing the "Out of Service" Status through Configuration in Work Orders

help.fracttal.com/hc/en-us/articles/40215962922765-Managing-the-Out-of-Service-Status-through-Configuration-in-Work-Orders

The "Out of Service" status of an asset can be managed through the configuration in the Work Orders module.

The option *"Set the out of service end date for assets with the task completion date"* determines how and when this status ends.

By default, this option uses the Work Order completion date.

The screenshot shows the Fracttal Settings interface. On the left, a sidebar menu lists various settings categories: General, User Accounts, Business Calendar, Modules (highlighted with a red arrow), Financial, Auxiliary Catalogs, Document Management, Transactions Log, Security, API Connections, Guest Portal, and Account. The main content area is titled 'Activación Fracttal - Español - 477' and features a 'Save' button. Below the title, there's a 'Type' dropdown menu set to 'Work Orders'. A table titled 'Options and permissions' lists various configuration options for Work Orders. The option 'Set the end date of out of service of the assets with the date of completion of the task (by default is the end date of the task)' is highlighted with a red box, and its toggle switch is currently turned on (blue).

Type	Options and permissions	Work order ID	Prints

Description																									
Allow end / cancel WOs with pending material requisitions	☒																								
Set the end date of out of service of the assets with the date of completion of the task (by default is the end date of the task)	☒																								
Allow assigned human resources to be responsible for the work order (Multi-responsible)	☒																								
Allow editing of the real used qty with pending material requisitions	☒																								
Allow to qualify the WO even though it is under review	☒																								
Filter human resources according to the selected profile (Within a task)	☒																								
Allow updating triggers with active WOs	☒																								
Establish mandatory completion of the failure catalog	☒																								
Enable task end or stop reason	☐																								
Automatically generate link to share all WO	☒																								

- **If enabled:** the out of service status will be updated upon task completion, without the need for the Work Order to be fully completed, allowing for more agile asset management.
- **If disabled:** for the out of service status to close, both the Work Order and the task must be completed, ensuring that the entire related process has been finished.

This option can be adjusted according to operational needs, providing flexibility in status management.
